HEALTHCARE

Cloud Migration

Medical Device Company

The challenge

A startup medical device company was enjoying substantial growth, however that growth was putting their existing infrastructure to the test. In an effort to meet growing demand, they retained navitend to help them decide how to build out their compute capacity to accommodate their recent and anticipated growth.

navitend's role

navitend identified the required software architecture, data rates, data volumes and growth curve for the business. With these important factors in-hand, we were able to perform a sensitivity analysis of the respective costs of using a top-tier cloud provider (Microsoft Azure) versus purchasing equipment and running it in a data center on owned hardware (colocated servers).

Colocation was the better solution

Our client had the information necessary to make an informed decision to purchase equipment and operate across multiple data centers. Despite the common thought that "cloud is always right", this company is poised for smart growth with always-on servers ready to cost-effectively handle their anticipated data volumes.

Talk to a person, not a ticket

Tell us what's going on. We'll listen, ask good questions, and give you informed and experienced guidance.
