M365 with legacy servers

Hybrid Networks

The challenge

Many SMB and Enterprise networks are straddling the “legacy” world of on-premises servers and the new world of subscription-based Microsoft 365 experiences. Doing this right takes intentionality, particularly with the additional constraint of storage and memory costs spiraling with the demand burden of data center buildouts related to the AI sector.

navitend’s role

navitend’s solid understanding of Microsoft servers, Microsoft 365 licensing and attention to detail brings solid and secure operations to our clients. Some applications are not cost-effective to “lift and shift” with legacy software requirements. Blending the on-premises applications, cost-effective backup and disaster recovery solutions and modern Entra Identity Management is the best approach in most cases. Another key component with hybrid deployments is the judicious deployment of Virtual Private Networks (VPNs). A VPN permits team members working remotely to securely access the software (and often printers) running internally.

Flexible operations

Cost-effective and secure operations are available for organizations running in a hybrid manner. Time will tell how long this model still works, however so long as the legacy software remains or there is specialty equipment running older operating systems, sophisticated solutions such as these modern hybrid approaches will be in demand. In a market where IT companies are increasingly “cloud only”, it helps to have a team like navitend’s who can still help with server infrastructure.
