CASE STUDY

HEALTHCARE · NONPROFITS

IT Consulting, Management, and Software Development

Long Term Care Non-Profit

The challenge

This entrepreneurial-minded non-profit serving thousands of vulnerable citizens has relied upon dated systems which constrained their operations.

navitend's role

navitend's team assumed management of their legacy applications, extending their useful life and bridging the gap to the next generation of software platform investments. Once the legacy application was stabilized, navitend's software team created a modern, secure application, running in parallel alongside the legacy application. Authentication, Authorization and Auditing capabilities were introduced, along with numerous new capabilities. Once the core functionality of the new application surpassed the legacy application, the new application was migrated to a secure cloud deployment. This allows the original servers to be decommissioned and avoid costly fees associated with a server hardware and software refresh project. The new environment leverages Microsoft Azure, Microsoft Entra ID, and Microsoft Business Central, yet is built in such a way that it is data center and accounting system agnostic, providing substantive flexibility over the anticipated life-span of the application.

The result

This organization has new capabilities never before available in their legacy application, and they are in a better posture to navigate increasing security regulations in their industry. With the transition to Microsoft Azure, new possibilities are opened up with respect to office leases and other fixed expenses.

The work continues. When the growing application's database became a bottleneck, our team used AI to find and fix the cause, without sharing any PHI.
